

# Centreon MAP

Actionable macro & micro visibility  
for better-informed ITOM\* \* IT Operations Management

## Now you're seeing beyond infrastructure

Is IT monitoring the tree that's hiding the forest? Look again! Centreon MAP takes IT monitoring beyond troubleshooting – helping you and key people at your company uncover the actionable, shareable IT insights that

underpin business outcomes. As IT Operations Management becomes a vital part of driving business growth, you have a rich story to tell – and like all good stories, it must be told with pictures.

Centreon MAP is our data-mapping and visualization tool for real time, shareable analysis of global IT services and network performance status. Designed with a dual studio-viewer application, it's always in sync with Centreon databases so you always have picture-perfect, relevant information. And it's not just about the look, Centreon MAP makes IT monitoring meaningful for proactive event management and incident resolution.

## Design user-relevant stories, from bird's-eye to microscopic

- ③ Use the extensive data mapping capabilities to create custom real-time views for different users or purposes
- ③ Analyze information and display it in drill-down tree structures or set of screens: geography, network topology, technical components, application, service or business activity, etc.
- ③ NOC-ready: assemble multiple data source views on one screen, directly from the Centreon Web interface and layer various data sources at will to sustain sharper analysis and decision-making
- ③ Display data in user-friendly and shareable graphs: topology, graphs, bar charts, pie charts, gauges, spark lines, etc., thanks to a rich object palette
- ③ Take instant top-down snapshots of user-level insights and turn them into real-time operational alerts and performance status using ACL-based authorization

## Always get the freshest view

Simplify the implementation of assets to your monitoring perimeter and gain more control on your mapping abilities. Systematic data synchronization with Centreon databases, facilitates updates based on parent-child relationships, object groups or dependencies each time a monitored resource is added, modified or deleted.

## Drag and drop for custom views

Centreon MAP's studio application is a dedicated IDE workspace with drag and drop tools that accommodate multiple administrators. Creating and manipulating custom views for different user functions and objectives is effortless. Display hundreds of thousands of graphic elements at a time on the rich studio application or on Centreon Web, yet maintain interactivity and ease of use for a variety of internal users.

## Act on what you see

Centreon MAP delivers functionalities that facilitate management in complex settings such as in NOCs, for monitoring multiple or massive sites. Be enabled to act on what you see with acknowledgement alerts and downtime triggering, planning and disabling.

## The end result? Better business outcomes

With Centreon MAP, ITOM and NOC teams are not only better informed, they are empowered to make other key decision makers in the company aware of the impact of IT performance and availability on business-critical operations.

## Show and tell the full story behind IT monitoring
